Lab 7: post lab report

IBCM was very hard to me, and I'm still struggling to understand the concept. In fact, the only IBCM I could write without help was `addition.ibcm` and for the rest, especially `bubblesort.ibcm`, TAs helped me a lot, almost explaining what I need to do step by step. Therefore, I do not feel very confident in writing IBCM. For me, the most difficult part is understanding the difference between simple load function (3000) and storing it as a variable (load holder) – how to do operations on them and what those operations mean. I believe that the simulation was very helpful, because it allows you to track what each operation is doing (Step) like `lldb` and `gdb`.
